

H2O Flow

And it goes like this

And it flows like this

Evaporation occurs when water becomes vapor
then water comes back to the land as precipitation
and seeps into the ground by infiltration
or flows across the land from rivers into the ocean

The water cycle

from the air to the land into the ground
and back to where the water's found.

My show, my H2O flow cycles around
and around.

And it goes like this

Yeah it flows like this

Runoff is H2O that flows and follows
a channel that goes to the ocean
The motion of H2O moving soil and stones
as it goes is known as erosion.

Deposition is the process in which
the soil and stone that erodes is
then deposited downstream
It seems that some
of this accumulation
becomes alluvium.

The water cycle

from the air to the land into the ground
and back to where the water's found.

My show, my H2O flow cycles around
and around.

The prose my foes compose
it's all frozen in snow
but mine flows like H-2-O
it explodes
and all those who oppose
they know
the gift bestowed upon
the chosen one it goes
like this
And it flows like this
