

## My Answers

A mineral is a naturally formed solid  
It's inorganic and it isn't a gas or a liquid  
It has a crystalline structure which means it's repeated  
Minerals are made of one or two types of elements  
The earth's crust has about ninety-two of them

And my answers are buried under the ground  
All the answers I have found  
(x2)

Each element is made of only one kind of atom  
An atom is the smallest part of an element that  
has all the element's properties – you heard what I said  
A compound is made up of two or more elements

And my answers are buried under the ground  
All the answers I have found  
(x2)

Silicate minerals include silicon and oxygen  
The earth's crust is made up of ninety percent silicate  
The hardness scale for minerals ranges from one to ten  
Talc is one and diamond you'll find right up the other end

(Yeah diamond is a number ten  
that's why it's a girl's best friend)
